## Software Developer (Full-Stack)

I am a recent graduate and Full-Stack Software Developer with over a year of relevant technical experience. My work is focused on maintaining the suite of software applications offered, and working with our clients to build them custom, user-friendly features that will help to improve their operations and customer experience. My goal is to continually challenge myself and to learn, all while making a positive impact. I am also trilingual in English, Spanish, and Persian.

## Experience

### Ormandy, Inc. – Remote | Full-Stack Developer | Oct 2024 – Present

- I am responsible for implementing multiple new features to the software product. The languages I use include:
  - HTML/CSS & JavaScript for updating application pages
  - Go for communicating with database and updating frontend page accordingly
  - MS SQL Server for storing, retrieving, and updating data and tables

- Accomplishments**

- Automated Email Notification for Upcoming Events in “Mobile Connect” App:**

I updated the existing email notification feature from being a button that is manually pressed by the user, to a feature that automatically runs in the background at a fixed time interval, checking for upcoming events in the calendar and notifying the customer at certain times leading up to the event. This update incorporated automation to the notification feature, improving precision and efficiency for the client and removing the manual actions previously required.

- New Customer Notifications Feature for "Mobile Connect" App:**

I implemented a new customer notifications feature that allows our clients to send notifications to their customers regarding upcoming events from the calendar, either by SMS or Email. Allowing the client to remind their customers of an upcoming scheduled event resulted in a noticeable improvement in client-customer relations.

- Customizable Email Templates in "Customer Portal" App:**

I enhanced customer email templates by replacing static strings with dynamic variables, allowing the client to customize the email content to their particular business preferences. As a result, I provided our clients with increased control of email templates for an improved customer experience.

## Skills

- Languages:** Java (3+ yrs) | Go (current) | SQL (current) | JavaScript (2+ yrs, current) | HTML/CSS (2+ yrs, current)
- Tools:** AWS | ReactJS | NodeJS | Git/GitHub/GitLab | Figma | Microsoft Office Suite
- Database:** MS SQL Server | MongoDB

## Education

- B.S Computer Science – August 2024
- University of Georgia | Overall GPA: 3.25
- Relevant Coursework: Database Management, Web Programming, Algorithms, Software Development

## Projects

### Athens Bahá'í Community Website (in-progress)

- As a member of the local Bahá'í community in Athens, GA, I volunteered to update our website with the goal of making it a great resource for people interested in learning more about The Bahá'í Faith and about the programs and activities within our community. This service project also serves as an opportunity for me to further polish my full-stack development skills and incorporating new software tools along the way.
- As of now, I have used Figma to brainstorm the front-end design of the website, ReactJS for implementation of each component of the website, and NodeJS for communicating with the server.
